Chapter # 2, **Author:** John Uffenbeck.

Addressing Mode and Categories

- ? The different ways in which a microprocessor can access data are referred to as its addressing modes.
- ? Addressing modes of 8086 Microprocessor are categorized as:
 - ? *Addressing Data*
 - ? *Addressing Program codes in memory*
 - ? *Addressing Stack in memory*
 - ? *Addressing I/O*
 - ? *Implied addressing*

Things to know...

- Instruction format

- Instructions can have 1, 2 or no operands

- **INC AX** ; 1 operand

- **ADD CX, DX** ; 2 operands

Destination source

- **HLT** ; no operand

$CX = CX + DX$

- Instruction cannot have:

- **SUB [DI], [1234h]** ; memory locations as both operands

- **MOV 2345, 5425** ; immediate data as both operands

- **MOV 1234, AX** ; immediate data as destination operand

1. Addressing Data

- I. Immediate addressing
- II. Direct addressing
- III. Register [direct] addressing
- IV. Register indirect addressing
- V. Base-plus-index addressing
- VI. Register relative addressing
- VII. Base-relative-plus-index addressing

1. Addressing Data

I. Immediate addressing

? Data is immediately given in the instruction

MOV BL, 11h

By default if no number system is given, we will consider it as **decimal**,d.

II. Direct addressing

? Data address is directly given in the instruction

MOV BX, [437AH]

1. Addressing Data

III. **Register [direct] addressing**

- ? Data is in a register (here BX register contains the data)

MOV AX, BX

IV. **Register [indirect] addressing**

- ? Register supplies the address of the required data

MOV CX, [BX]

1. Addressing Data

v. **Base-plus-index addressing**

- ? Base register is either BX or BP
- ? Index register is either DI or SI

MOV DX, [BX+DI]

v. **Register relative addressing**

- ? Register can be a base (BX, BP) or an index register (DI, SI)
- ? Mainly suitable to address array data

MOV AX, [BX+1000]

1. Addressing Data

VII. **Base-relative-plus-index addressing**

? Suitable for array addressing

MOV AX, [BX+DI+I 0]
MOV [BX+DI+I 0],AX

2. Addressing Program Codes in Memory

? Used with JMP and CALL instructions

? 3 distinct forms:

- I. Direct
- II. Indirect
- III. Relative

2. Addressing Program Codes in Memory

? Address is directly given in the instruction

JMP ^{IP}1000: ^{CS}0000

JMP doagain ; doagain is a **label** in code

CALL 1000:0000

CALL doagain ; doagain is a **procedure** in code

? Often known as *far* jump or *far* call

2. Addressing Program Codes in Memory

? Address can be obtained from

? **a)** any GP registers (AX,BX,CX,DX,SP,BP,DI,SI)

JMP AX
*IP = AX ; then CS :
IP*

? **b)** any relative registers ([BP],[BX],[DI],[SI])

JMP [BX]
*IP = what is inside the physical address of DS : BX ; then CS
: IP*

? **c)** any relative register with displacement

JMP [BX + 100h]
*IP = what is inside the physical address of DS : BX + 100h ; then CS
: IP*

Address	31234h	31235h	12000h	12001h	30600h	30601h
Data	12h	34h	10h	20h	11h	21h

- A. Assume for an 8086, **DS = 1000h**, **CS = 3000h**, **SS = 8A40h**, **BX = 2000h**, **BP = 1234h**, **SI = 0020h**, **DI = 030Fh**. We also execute the **JMP [BX]** instruction. Now, deduce the **physical address** of the memory location 8086 will jump to. [4]

Address	31234h	31235h	30600h	30601h	40600h	40601h
Data	12h	34h	11h	21h	30h	40h

- A. Assume for an 8086, **DS = 4000h, CS = 3000h, SS = 8A40h, BX = 2000h, BP = 1234h, SI = 600h, DI = 030Fh**. We also execute the **JMP [SI]** instruction. Now, deduce the **physical address** of the memory location 8086 will jump to. [4]

Answer the questions based on the given table and data

I

Physical Address	8 bit hex data
14001h	78h
14000h	56h
13001h	34h
13000h	12h
03000h	ABh

Given DS = **1000h**, CS = **3000h**, SS = **8A40h**, SI = **2000h**, CX = **43AEh**, DI = **030Fh**. We also execute the **JMP [SI + 1000h]** instruction. Now, answer the questions based on the given table and data:

3. Addressing Stack in Memory

- **PUSH** and **POP** instructions are used to move data to and from stack (in particular from stack segment).

PUSH AX

POP CX

- **CALL** also uses the stack to hold the return address for procedure.

CALL SUM ; SUM is a procedure name

4. Addressing Input and Output Port

? IN and OUT instructions are used to address I/O ports

? Could be *direct addressing*

IN AL, 05h ; Here 05h is a input port number

? or *indirect addressing*

OUT DX, AL ; DX contains the address of I/O port

? Only DX register can be used to point a I/O port

5. Implied Addressing

- ? No explicit address is given with the instruction
- ? implied within the instruction itself
- ? Examples:

CLC ; clear carry flag

HLT ; halts the program

RET ; return to DOS

8086 Machine Codes

Dept. of Computer Science and Engineering
BRAC University

CSE 341 Team

Instruction template

- ? For 8085: Just look up the hex code for each instruction.
- ? For 8086 it is not simple.
- ? E.g 32 ways to specify the source in **MOV CX, source**.
- ? **MOV CX, source**
 - a 16-bit register (8 in number)*
 - a memory location (24 possible memory addressing modes)*
- ? Each of these 32 instructions require different binary code.
- ? Impractical to list them all in a table.
- ? Instruction templates help code the instruction properly.

Instruction template (6 bytes)

An instruction after conversion can have 1 to 6 bytes long of machine code

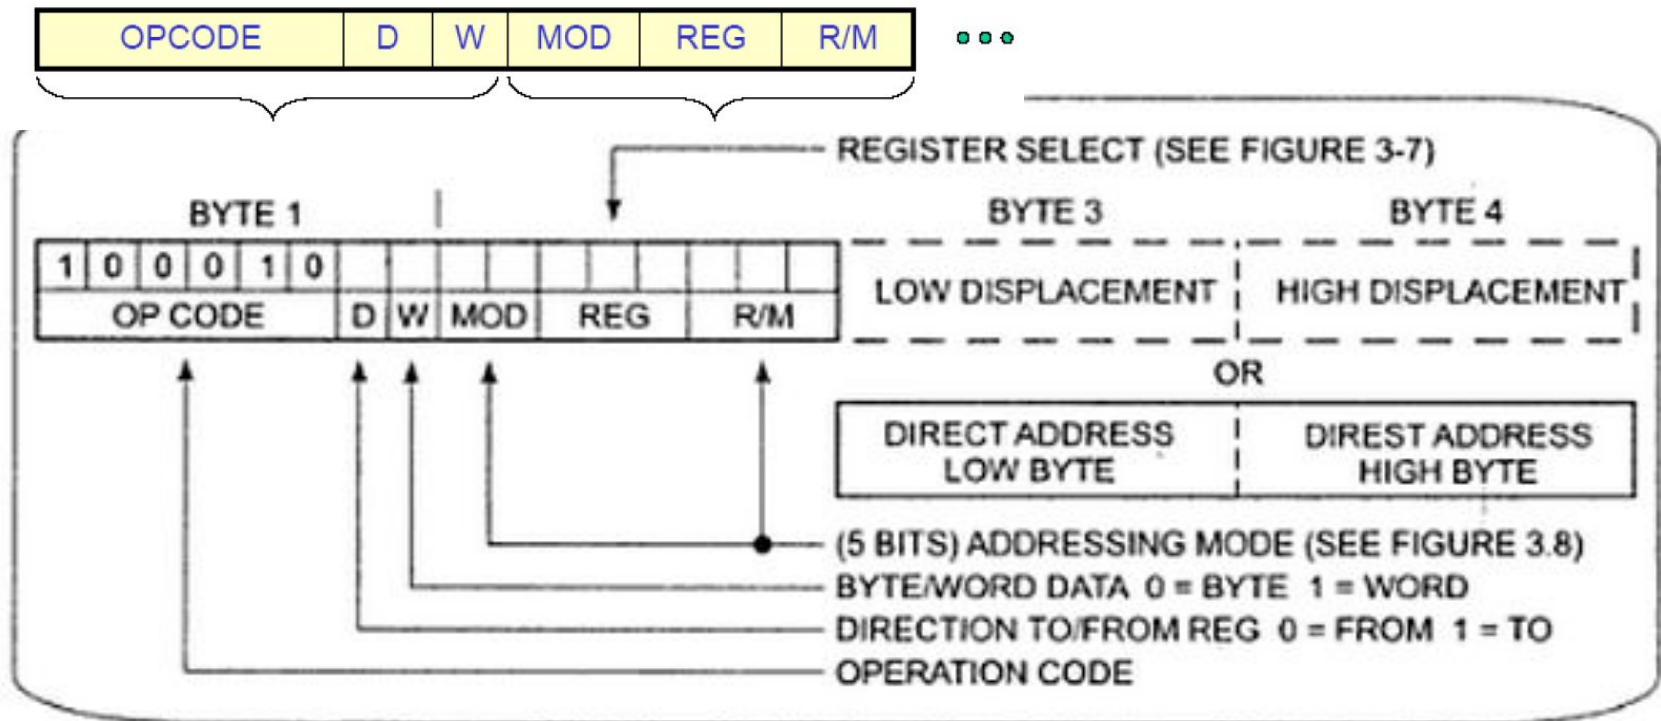

Constructing Machine Codes for 8086

- ? Each instruction in 8086 is associated with the binary code.
- ? You need to locate the codes appropriately.
- ? Most of the time this work will be done by assembler
- ? The things needed to keep in mind is:
 - ? Instruction templates and coding formats
 - ? MOD and R/M Bit patterns for particular instruction

MOV Instruction Coding

? MOV data from a register to a register/to a memory location
or from a memory location to a register.

(Operation Code of MOV: 100010)

MOD and R/M Field

- ? 2-bit Mode (MOD) and 3-bit Register/Memory (R/M) fields specify the other operand.
- ? Also specify the addressing mode.

RM \ MOD	MOD			
	00	01	10	11
				W = 0 W = 1
000	[BX] + [SI]	[BX] + [SI] + d8	[BX] + [SI] + d16	AL AX
001	[BX] + [DI]	[BX] + [DI] + d8	[BX] + [DI] + d16	CL CX
010	[BP] + [SI]	[BP] + [SI] + d8	[BP] + [SI] + d16	DL DX
011	[BP] + [DI]	[BP] + [DI] + d8	[BP] + [DI] + d16	BL BX
100	[SI]	[SI] + d8	[SI] + d16	AH SP
101	[DI]	[DI] + d8	[DI] + d16	CH BP
110	d16 (direct address)	[BP] + d8	[BP] + d16	DH SI
111	[BX]	[BX] + d8	[BX] + d16	BH DI

MOD and R/M Field

- ? If the other operand in the instruction is also one of the eight register then put in 11 for MOD bits in the instruction code.
- ? If the other operand is memory location, there are 24 ways of specifying how the execution unit should compute the effective address of the operand in the main memory.
- ? If the effective address specified in the instruction contains displacement less than 256 along with the reference to the contents of the register then put in 01 as the MOD bits.
- ? If the expression for the effective address contains a displacement which is too large to fit in 8 bits then out in 10 in MOD bits.

REG Field

? REG field is used to identify the register of the one operand

REG	W = 0	W = 1
000	AL	AX
001	CL	CX
010	DL	DX
011	BL	BX
100	AH	SP
101	CH	BP
110	DH	SI
111	BH	DI

Instruction template

6 bits of
MOV, ADD etc

D - direction

If **D=0**, then direction is from a register (source)
If **D=1**, then direction is to a register (destination)

W - word

If **W=0**, then only a byte is being transferred (8 bits)
If **W=1**, then a whole word is being transferred (16 bits)

- 34h here is an 8-bit displacement
- [BX+34h] is a memory/offset address

MOV [BX + 34h], AL

MOV AX, 1234h

- 1234h here is a 16-bit immediate data value

MODE	OPERAND NATURE
00	Memory with no displacement → <i>MOV AX, [BX]</i>
01	Memory with 8-bit displacement → <i>MOV AX, [BX + 12h]</i>
10	Memory with 16-bit displacement → <i>MOV AX, [BX + 1234h]</i>
11	Both are registers → <i>MOV AX, BX</i>

Instruction	D	W	MOD
MOV BL , [1234H]	1	0	00
MOV [DX], BX	0	1	00
MOV [BX + SI + 1000H], AX	0	1	10
MOV AL, [DI + 34H]	1	0	01
MOV CX, DX	0/1	1	11
MOV [2344H], [1234H]	Not Valid		
MOV 2344H, CX	Not Valid		

$$[DI + 34h] = [DI]34h = 34h[DI]$$

Instruction template

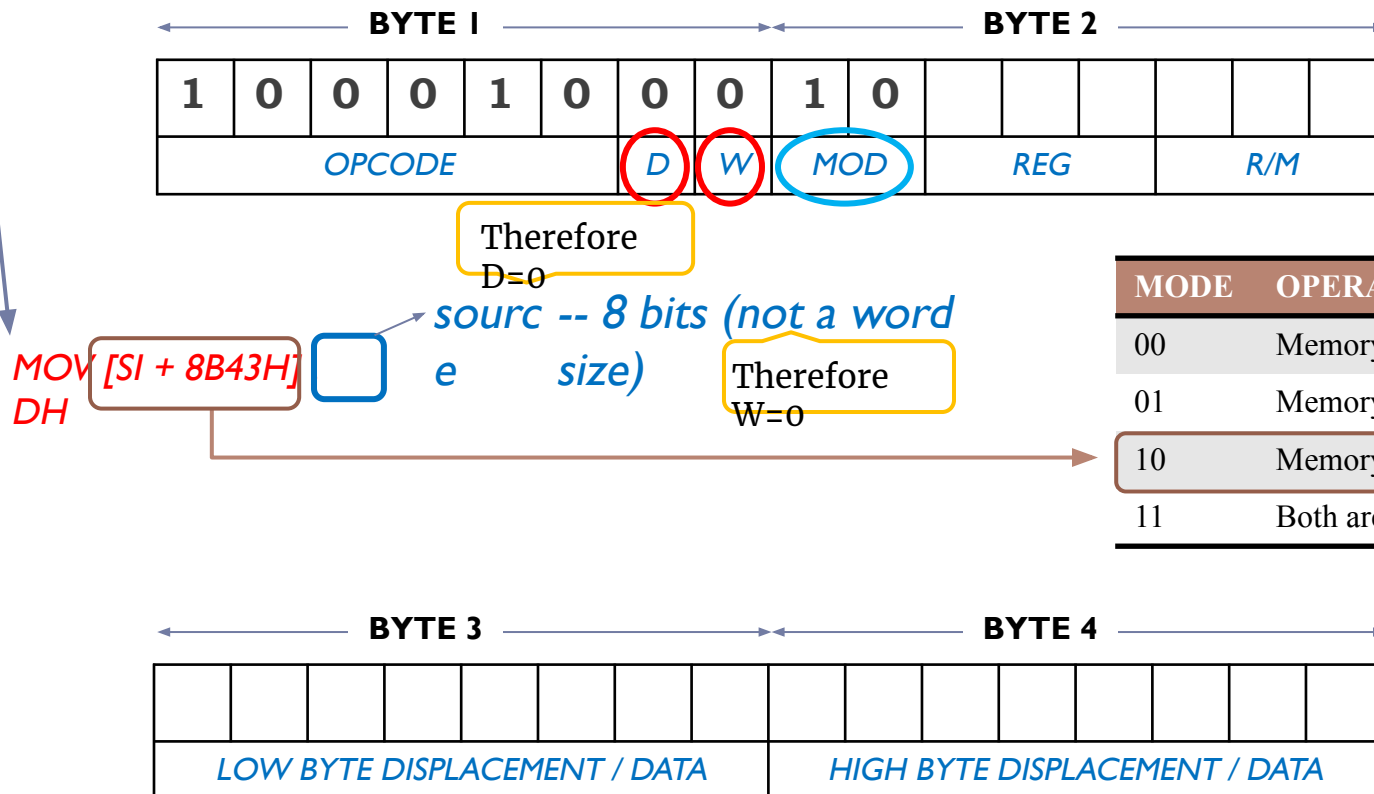

- Value for R/M with corresponding MOD value
- Value for REG with corresponding W value and the register considered in D

Check column that matches with MOD value

RM	MOD				
		00	01	10	11
					W = 0 W = 1
000		[BX] + [SI]	[BX] + [SI] + d8	[BX] + [SI] + d16	AL AX
001		[BXI] + [DI]	[BX] + [DI] + d8	[BX] + [DI] + d16	CL CX
010		[BP] + [SI]	[BP] + [SI] + d8	[BP] + [SI] + d16	DL DX
011		[BP] + [DI]	[BP] + [DI] + d8	[BP] + [DI] + d16	BL BX
100		[SI]	[SI] + d8	[SI] + d16	AH SP
101		[DI]	[DI] + d8	[DI] + d16	CH BP
110		d16 (direct address)	[BP] + d8	[BP] + d16	DH SI
111		[BX]	[BX] + d8	[BX] + d16	BH DI

Example 1

? **MOV 8B43H [SI], DH**: Copy a byte from DH to memory with 16 bit displacement given the opcode for MOV=100010

MODE	OPERAND NATURE
00	Memory with no displacement
01	Memory with 8-bit displacement
10	Memory with 16-bit displacement
11	Both are registers

Example 1

? **MOV 8B43H [SI], DH:** Copy a byte from DH to memory with 16 bit displacement given the opcode for MOV=100010

MOV [SI + 8B43H],
DH

RM \ MOD	MOD					
	00	01	10	11	W = 0	W = 1
000	[BX] + [SI]	[BX] + [SI] + d8	[BX] + [SI] + d16	AL	AX	
001	[BXI] + [DI]	[BX] + [DI] + d8	[BX] + [DI] + d16	CL	CX	
010	[BP] + [SI]	[BP] + [SI] + d8	[BP] + [SI] + d16	DL	DX	
011	[BP] + [DI]	[BP] + [DI] + d8	[BP] + [DI] + d16	BL	BX	
100	[SI]	[SI] + d8	[SI] + d16	AH	SP	
101	[DI]	[DI] + d8	[DI] + d16	CH	BP	
110	d16 (direct address)	[BP] + d8	[BP] + d16	DH	SI	
111	[BX]	[BX] + d8	[BX] + d16	BH	DI	

Note: The MOD 110 and the REG field DH are circled in red. Arrows indicate the mapping from the instruction format to the table.

Example 1

? **MOV 8B43H [SI], DH:** Copy a byte from DH to memory with 16 bit displacement given the opcode for MOV=100010

MOV [SI + 8B43H],
DH

RM \ MOD	MOD					
	00	01	10	11	W = 0	W = 1
000	[BX] + [SI]	[BX] + [SI] + d8	[BX] + [SI] + d16		AL	AX
001	[BXI] + [DI]	[BX] + [DI] + d8	[BX] + [DI] + d16		CL	CX
010	[BP] + [SI]	[BP] + [SI] + d8	[BP] + [SI] + d16		DL	DX
011	[BP] + [DI]	[BP] + [DI] + d8	[BP] + [DI] + d16		BL	BX
100	[SI]	[SI] + d8	[SI] + d16		AH	SP
101	[DI]	[DI] + d8	[DI] + d16		CH	BP
110	d16 (direct address)	[BP] + d8	[BP] + d16		DH	SI
111	[BX]	[BX] + d8	[BX] + d16		BH	DI

Example 1

? **MOV 8B43H [SI], DH:** Copy a byte from DH to memory with 16 bit displacement given the opcode for MOV=100010

MOV [SI + 8B43H],
DH

Machine Code: 1000 1000 1011 0100 0100 0011 1000 1011₂ or 88 B4 43 8B₁₆

Example 2

? **MOV AX, BX:** given the opcode for MOV=100010

Example 2

? **MOV AX, BX:** given the opcode for MOV=100010

Considering
AX
to be our main
register

RM	MOD				W = 0		W = 1
		00	01	10			
000		[BX] + [SI]	[BX] + [SI] + d8	[BX] + [SI] + d16	AL		AX
001		[BX] + [DI]	[BX] + [DI] + d8	[BX] + [DI] + d16	CL		CX
010		[BP] + [SI]	[BP] + [SI] + d8	[BP] + [SI] + d16	DL		DX
011		[BP] + [DI]	[BP] + [DI] + d8	[BP] + [DI] + d16	BL		BX
100		[SI]	[SI] + d8	[SI] + d16	AH		SP
101		[DI]	[DI] + d8	[DI] + d16	CH		BP
110		d16 (direct address)	[BP] + d8	[BP] + d16	DH		SI
111		[BX]	[BX] + d8	[BX] + d16	BH		DI

Example 2

Machine Code: *1000 1011 1100 0011*₂ or *8B C3*₁₆

? MOV AX, BX: given the opcode for MOV=100010

RM	MOD					
		00	01	10	11	
						W = 0 W = 1
000		[BX] + [SI]	[BX] + [SI] + d8	[BX] + [SI] + d16	AL	AX
001		[BX] + [DI]	[BX] + [DI] + d8	[BX] + [DI] + d16	CL	CX
010		[BP] + [SI]	[BP] + [SI] + d8	[BP] + [SI] + d16	DL	DX
011		[BP] + [DI]	[BP] + [DI] + d8	[BP] + [DI] + d16	BL	BX
100		[SI]	[SI] + d8	[SI] + d16	AH	SP
101		[DI]	[DI] + d8	[DI] + d16	CH	BP
110	d16 (direct address)		[BP] + d8	[BP] + d16	DH	SI
111		[BX]	[BX] + d8	[BX] + d16	BH	DI

Example 2 (Alternative)

- MOV AX, BX**

Now Considering BX to be our main register

OPCODE						D	W
1	0	0	0	1	0	0	1

Here, since BX is our MAIN register and it at source so **D = 0**

MOD		REG			R/M		
1	1	0	1	1	0	0	0

Here for REG, we are considering BX

Here for R/M, we are considering AX

Example 3

- MOV [1234H], DL**

RM \ MOD	MOD			
	00	01	10	11
				W = 0 W = 1
000	[BX] + [SI]	[BX] + [SI] + d8	[BX] + [SI] + d16	AL AX
001	[BXI] + [DI]	[BX] + [DI] + d8	[BX] + [DI] + d16	CL CX
010	[BP] + [SI]	[BP] + [SI] + d8	[BP] + [SI] + d16	DL DX
011	[BP] + [DI]	[BP] + [DI] + d8	[BP] + [DI] + d16	BL BX
100	[SI]	[SI] + d8	[SI] + d16	AH SP
101	[DI]	[DI] + d8	[DI] + d16	CH BP
110	d16 (direct address)	[BP] + d8	[BP] + d16	DH SI
111	[BX]	[BX] + d8	[BX] + d16	BH DI

OPCODE						D	W
1	0	0	0	1	0	0	0

MOD		REG			R/M		
0	0	0	1	0	1	1	0

Low 8 Bit / Low 1 Byte / Low 2 Hex Digit							
0	0	1	1	0	1	0	0

High 8 Bit / High 1 Byte / High 2 Hex Digit							
0	0	0	1	0	0	1	0

Example 4

- MOV 1234H, DL**

RM \ MOD	MOD			
	00	01	10	11
				W = 0 W = 1
000	[BX] + [SI]	[BX] + [SI] + d8	[BX] + [SI] + d16	AL AX
001	[BX] + [DI]	[BX] + [DI] + d8	[BX] + [DI] + d16	CL CX
010	[BP] + [SI]	[BP] + [SI] + d8	[BP] + [SI] + d16	DL DX
011	[BP] + [DI]	[BP] + [DI] + d8	[BP] + [DI] + d16	BL BX
100	[SI]	[SI] + d8	[SI] + d16	AH SP
101	[DI]	[DI] + d8	[DI] + d16	CH BP
110	d16 (direct address)	[BP] + d8	[BP] + d16	DH SI
111	[BX]	[BX] + d8	[BX] + d16	BH DI

Not valid. No machine code.

Example 5

MOV DH, [BP+SI+7Dh]

RM \ MOD	MOD			
	00	01	10	11
				W = 0 W = 1
000	[BX] + [SI]	[BX] + [SI] + d8	[BX] + [SI] + d16	AL AX
001	[BX] + [DI]	[BX] + [DI] + d8	[BX] + [DI] + d16	CL CX
010	[BP] + [SI]	[BP] + [SI] + d8	[BP] + [SI] + d16	DL DX
011	[BP] + [DI]	[BP] + [DI] + d8	[BP] + [DI] + d16	BL BX
100	[SI]	[SI] + d8	[SI] + d16	AH SP
101	[DI]	[DI] + d8	[DI] + d16	CH BP
110	d16 (direct address)	[BP] + d8	[BP] + d16	DH SI
111	[BX]	[BX] + d8	[BX] + d16	BH DI

OPCODE						D	W
1	0	0	0	1	0	1	0

MOD		REG			R/M		
0	1	1	1	0	0	1	0

Low 8 Bit / Low 1 Byte / Low 2 Hex Digit							
0	1	1	1	1	1	0	1

There is no 4th Byte

Machine Code Size

MOD = 00

1. MOV [1234H], DL → 4 bytes
2. MOV AX, [BX] → 2 bytes

MOD = 01

MOV DH, [BP + 7Dh] → 3 bytes

MOD = 10

MOV DH, [BP + 712Dh] → 4 bytes

MOD = 11

MOV DH,AL → 2 bytes

- **89807812h to instruction**

- **8A167812h to instruction**

Thus, the instruction will be `MOV [BX+SI+1278h],AX`

Find the address mode, mod value and byte length

Instruction	Addressing Mode	Mod	Byte Length
MOV AH, BL	Register Direct Addressing	11	2
MOV [AX], BL	Register Indirect Addressing	00	2
MOV CX, [BP + SI + 3452h]	Base relative plus index Addressing	10	4
MOV [AH], [BL]	Not Valid	-	-
MOV [BX + DI], AX	Base plus index Addressing	00	2
MOV [BX + 22h], AX	Base plus relative	01	3
MOV AX, [1422h]	Direct Addressing	00	4
MOV 1234h[SI], AX	Base plus relative	10	4

Instruction Template

- ? The Intel literature shows two different formats for coding 8086 instructions.
- ? Instruction templates help you to code the instruction properly.

? **Example:**

IN AL, 05H

Example

- MOV BL,AL
- Opcode for MOV = 100010
- We'll encode AL so
 - D = 0 (AL source operand)
- W bit = 0 (8-bits)
- MOD = 11 (register mode)
- REG = 000 (code for AL)
- R/M = 011

OPCODE	D	W	MOD	REG	R/M
100010	0	0	11	000	011

Example

? **MOV 43H [SI], DH:** Copy a byte from DH register to memory location.

Example 3

? **MOV CX, [437AH]:** Copy the contents of the two memory locations to the register CX.

Thank You !!!
